

TESTING DOCUMENT

Project Information

Project Name: Django Backend Integration Task

Framework: Django 5.2

Database: PostgreSQL

Testing Date: 06 June 2026

Environment: Local Development Environment

Developer name: Aliza muskan

1. User Module Testing

Test Case 1: User Creation

Objective:

Verify that a user can be created successfully through Django Admin.

Steps Performed:

1. Login to Django Admin.
2. Open Users section.
3. Click Add User.
4. Enter Name, Email and Profile Image.
5. Save record.

Expected Result: User record should be saved successfully.

Actual Result: User record created successfully

Status: PASS 

2. Cloudinary Integration Testing

Test Case 2: Profile Image Upload

Objective:

Verify that uploaded images are stored on Cloudinary instead of local storage.

Steps Performed:

1. Create a new user through Django Admin.
2. Upload a profile image.
3. Save the record.
4. Check generated image URL.
5. Verify image in Cloudinary Dashboard.

Expected Result: Image should be uploaded to Cloudinary and accessible through a Cloudinary URL.

Actual Result: image uploaded successfully and accessible through Cloudinary.

Status: PASS

Test Case 3: Welcome Email Delivery

Objective:

Verify that a welcome email is automatically sent when a user is created.

Steps Performed:

1. Create a new user from Django Admin.
2. Monitor application logs.
3. Check recipient email inbox.

Expected Result:

A welcome email should be delivered successfully.

Actual Result:

Email delivered successfully.

Status: PASS ✓

4. Gemini AI Integration Testing

Test Case 4: AI Response Generation

Objective:

Verify that Gemini AI automatically generates a response for a prompt.

Steps Performed:

- 1. Open AIRequest model in Django Admin.
- 2. Create a new prompt.
- 3. Save the record.
- 4. Verify generated response.

Test Input:

What is bird?

Expected Result:

Gemini AI should generate a response automatically.

Actual Result:

Response generated successfully and stored in database.

Status: PASS 

Django administration

☐	ID	PROMPT	RESPONSE	CREATED AT
☐	6	what is bird?	A bird is a type of warm-blooded, egg-laying vertebrate animal that is primarily distinguished by the presence of feathers , a beak (or bill) with no teeth, two wings , and typically the ability to fly . Here are the key characteristics that define a bird: 1. Feathers: This is the most unique and defining feature of birds. No other living animal has feathers. Feathers serve multiple purposes: insulation (keeping warm), flight (creating lift and thrust), display (attracting mates, camouflage), and protection. 2. Wings: All birds have two wings. While most species use them for flight, some have wings adapted for swimming (penguins), balance, or display, and some (like ostriches and emus) are flightless. 3. Beak (or Bill): Birds do not have teeth. Instead, they have a horny beak or bill whose shape varies widely depending on the bird's diet and lifestyle (e.g., sharp for tearing, strong for cracking nuts, slender for probing nectar). 4. Egg-laying: Birds reproduce by laying hard-shelled eggs. These eggs are typically incubated by one or both parents in a nest until they hatch. 5. Warm-blooded (Endothermic): Birds can regulate their own body temperature, maintaining a high and constant internal temperature, often higher than mammals. This requires a high metabolic rate. 6. Lightweight Skeleton: Birds have many skeletal adaptations for flight, including hollow or pneumatic bones (air-filled), a fused backbone, and a keeled sternum (breastbone) for the attachment of powerful flight muscles. 7. Four-chambered Heart: Like mammals, birds have an efficient four-chambered heart that completely separates oxygenated and deoxygenated blood, supporting their high metabolic needs. 8. Efficient Respiratory System: They have a unique respiratory system with air sacs that allows for a continuous flow of fresh air through their lungs, making oxygen uptake highly efficient. Birds are incredibly diverse, ranging in size from the tiny bee hummingbird to the massive ostrich. They inhabit almost every ecosystem on Earth, from polar regions to tropical rainforests and vast oceans. They are believed to have evolved from feathered dinosaurs.	June 6, 2026, 4:57 p.m.

Test Case 5: Payment Intent Creation

Objective:

Verify that Stripe Payment Intent is automatically created.

Steps Performed:

- 1. Create a payment record through Django Admin.
- 2. Select user.
- 3. Enter payment amount.
- 4. Save record.
- 5. Verify Payment Intent in Stripe Dashboard.

Expected Result:

Stripe Payment Intent should be created automatically and stored in database.

Actual Result:

Payment Intent created successfully and stored.

Status: PASS

```

Error 1

Error:

Database is locked

Cause:

SQLite database locking issue during concurrent operations.

Resolution:

Migrated project from SQLite to PostgreSQL.

Status: Resolved

5 what is mouse? Gemini Error: 404 NOT_FOUND. {'error': {'code': 404, 'message': 'models/gemini-1.5-flash is not found for API version v1beta, or is not supported for generateContent. Call ModelService.ListModels to see the list of available models and their supported methods.'}, 'status': 'NOT_FOUND'}}

Error 2

Error:

Gemini Model Not Found (404 Error)

Cause:

Deprecated Gemini model name was being used.

Resolution:

Updated project configuration to use a supported Gemini model.

Status: Resolved

Error 3

Error:

EmailJS 403 Error

Message:

API access from non-browser environments is currently disabled.

Cause:

EmailJS security settings blocked server-side requests.

Resolution:

Enabled API access and configured EmailJS Private Key.

Status: Resolved 

Cause:

Free-tier Gemini API usage limit was reached during testing.

Resolution:

Used a new API key / waited for quota reset and retried the request successfully.

Status: Resolved 

Error 6

Error:

Current API Key Does Not Support Requested Model

Message:

404 model not found or model not supported for current API version.

Example Message:

models/gemini-1.5-flash is not found for API version v1beta,

or is not supported

The Gemini model being used was deprecated or not available for the current API key/version.

Resolution:

Checked available Gemini models and updated the project to use a supported model.

Status: Resolved 

Error 7

Error: RecursionError: maximum recursion depth exceeded while calling a Python object

Cause: A naive implementation of the `post_save` signal triggered another `.save()` call inside itself, creating an infinite loop while saving `AIRequest` or `Payment` models.

Resolution: Refactored the signals to use Django's query set `.update()` method (e.g., `Payment.objects.filter(id=instance.id).update(...)`) which updates values directly in the database without re-triggering the `post_save` signal.

Status: Resolved
